HUMANITY WILL NEVER BE ABLE TO FLY OUTSIDE THE SOLAR SYSTEM

By Vitaly Pilkin

Abstract

This paper presents a reasonable hypothesis that, even possessing the necessary technologies, humanity will never be able to fly outside the solar system.

Background Information

The above hypothesis is based on my theory of the nature of the universe, outlined in my research paper "The Universe and Man" [1], which, in particular, sets out the following:

The Supreme Mind is a universal developing intelligent informational system of the highest level of development, which governs the immaterial and material worlds of the Universe. The Supreme Mind is an energy-informational object of the immaterial world of the Universe. The Supreme Mind develops due to the development of souls that have reached the highest level of development. Humans call the Supreme Mind God.

The soul is a developing intelligent informational system that possesses thinking, intellect and consciousness. The soul is an energy-informational object of the immaterial world of the Universe.

The Information Field is a regional developing intelligent informational system of the highest level of development, which purposefully manages the development of souls in the part of the Universe assigned to it by the Supreme Mind. It was created by the Supreme Mind, is part of the Supreme Mind, and is governed by the Supreme Mind. The Information Field is an energy-informational object of the immaterial world of the Universe.

The function of the Information Field is to manage purposefully the development of souls throughout their entire evolutionary journey—from the moment of their emergence until the soul reaches the highest level of development. When a soul reaches the highest level of development, it becomes part of the Supreme Mind and is no longer under the control of the Information Field.

The means by which the Information Field manages the development of souls are information and energy.

The Information Field is a kind of incubator for "growing" souls for the benefit of the Supreme Mind.

The number of Information Fields in the Universe is equal to the number of material worlds where souls, for the purpose of their development, incarnate into biological beings living in these worlds.

The regional nature of the Information Field is determined by:

- the need to optimize the consumption of energy-information resources of the Universe used by the Information Field while implementing its functions,
- the specifics of the use of energy-information resources of the Universe by the Information Field while implementing its functions in various material worlds,
- the specifics of the development of souls in various material worlds.

The incarnation of a soul into a human being is an energy-informational interaction between the soul and the human being, limited by the lifespan of the human being, for realizing the earthly stage of the soul's development.

A human is a biological social being who possesses speech, and into whom a soul has incarnated.

I am a young soul, incarnated into a human being to undergo my earthly stage of development. During my earthly stage of development, I am my human body, my thinking, intellect and consciousness, my life in a human body.

Human thinking is the ability of a soul that has incarnated into a human being, limited by the level of development of the human brain, to manage the search, receipt and processing of information that the human brain carries out, to understand and manage the received and processed information.

Human intellect is the ability of a soul that has incarnated into a human being, limited by the level of development of human thinking, to manage the transformation of information that the human brain carries out, and to manage the transformed information.

Human consciousness is the personal attitude of a soul that has incarnated into a human being to the external world, limited by the level of development of human thinking and intellect, which arises as a result of the awareness of itself as an intelligent being, different from the external world.

It is the soul incarnated into a human being, not the human brain, possesses thinking, intellect and consciousness.

Humanity is a collection of young souls with varying levels of development of thinking, intellect and consciousness, who undergo their earthly stage of development through incarnation into humans.

The Information Field manages human’s fate (that is, the fate of the soul during its incarnation into a human being) as follows:

- decides when, where, into which human, and at what level of brain development to incarnate the soul (the higher the level of human brain development, the more developed the soul that incarnates into a human being; the higher the level of soul development, the higher the level of its thinking, intellect and consciousness),
- controls the human brain and any information that a human searches for, receives, processes, transforms, and uses throughout his life,
- decides when and what information to provide to a human to resolve fateful and problematic situations that arise in a human's life, which appears in the human brain as thoughts,
- imposes on a human the making of decisions and the performance of actions that shape and realize the human's fate,
- shapes the events and circumstances that a human encounters along his life path, which shape and realize the human's fate,
- determines the duration of the soul's incarnation into a human,

- decides when to terminate the soul's incarnation into a human (that is, decides when to end a human's life),
- plans and implements the optimal development of the soul during its earthly stage of development, and, if necessary, corrects the fate of the soul by means of its development or education, or punishment, or any combination of them.

Human long-term memory (the large volume of information accumulated throughout life that a human does not actively use) is not stored in the human brain, but in the Information Field.

Human death is the end of the soul's incarnation into a human being. There is no human being without a soul.

After the end of its incarnation into a human being, the soul's life consists of a series of alternating experiences in the immaterial world and incarnations into human beings. All these processes are managed by the Information Field.

Hypothesis

Even possessing the necessary technologies, humanity will never be able to fly outside the solar system.

Justification for the Hypothesis

Considering the regional nature of the Information Field, its functions in managing souls incarnated into humans are limited to the solar system.

How far beyond the solar system the Information Field can perform its functions in managing souls incarnated into humans is unknown.

In the event of a human flight into deep space (space beyond the Solar System), the human may go beyond the Information Field's coverage area, and then the Information Field will be unable to perform its functions in managing the soul incarnated into a human.

As a result of a human leaving the Information Field's zone of influence, the human will fall out of the Information Field's control, which means the following:

- the Information Field ceases to manage a human's destiny,
- the Information Field ceases to provide informational support to a human to resolve problematic and fateful situations that arise along his life's path,
- the Information Field ceases a human's access to a human's long-term memory, which is stored in the Information Field,
- to resolve problematic and fateful situations, a human is forced to rely solely on his free will (for more information on human free will, see "The Fate and Free Will of Man and Society" [2]),
- due to the fact that young souls incarnate into humans with a low level of development of thinking, intellect and consciousness, then, without the informational support of the Information Field, a human will not be able to correctly manage his free will and resolve problematic and fateful situations that will arise along his life's path,
- after a human's natural death, the soul will not be able to return to the Information Field's zone

of influence due to the lack of the necessary energy,

- the inability of the soul to return to the zone of action of the Information Field means the gradual destruction of the soul by the external energetic influence of the Universe.

Given the above perspective, the Information Field will likely simply not release the soul incarnated into a human being from its control, as this would mean sending the soul to certain death. Therefore, if there is a threat of the soul incarnated into a human being leaving the Information Field's zone of influence, the Information Field will likely cease the soul's incarnation into the human being. The cessation of the soul's incarnation into a human being means the death of the human being.

Even if the Information Field releases the soul incarnated into a human from its control and the human reaches some distant planet beyond the Solar System, without the informational support of the Information Field, the human, due to the low level of development of his thinking, intellect and consciousness, will hardly be able to cope with the problematic and fateful situations he will encounter along his life's path in the new material world. Furthermore, after a human's natural death, already in the new material world, the soul that was incarnated into the human will perish, as it will not be able to return back under the control of its Information Field.

Hibernation (the physiological state of deep sleep) during a human flight into deep space will not solve the problem, since for the soul incarnated into a human it makes no difference whether the soul emerges from the control of the Information Field while the human body is asleep or awake.

If my hypothesis is correct, then humanity's dreams of exploring deep space and the possible resettlement of humanity to other planets beyond the Solar System will remain just dreams.

How to Test the Hypothesis

If there are aliens (i.e. biological intelligent beings of extraterrestrial origin) on Earth, not born on Earth and possessing a brain, thinking, intellect and consciousness, and they are capable of solving problematic and fateful situations, then:

- my hypothesis is wrong,
- sometime in the future, possessing the necessary technologies, humanity will be able to fly outside the solar system and explore the deep space.

Conclusion

Humanity should consider the problem raised in this paper now, so as to avoid risking human lives in the future, wasting colossal resources on preparing for deep space flights, and relying vainly on the possibility of resettling humans on distant planets beyond the solar system.
